

LIA PLUS AI Assignment

Intuition: According to the question whatever I got is that I need to make a workflow of Conversation AI assistant where this assistant helps student who wants to take admission in a Nursing College or want to know about the college.

Approach:

In my opinion the question is not that clear to me but I whatever I got is that, given that it's a nursing college assistant but there is only one input here that is Nursing college. Its not like we need to take an API key to generate responses from gemini or openai.

1. I created some functions for some features like input, fee structure, eligibility etc
2. I used some IF-ELSE statement for Dividing the response (Positive and Negative)
3. Lastly, I call the functions

Flow chart:
